

Retail Shop Case Study & Business Insights by PostgreSQL

Overview

Urban Cart is a fast-growing online retail shop that sells a wide range of products to customers across different cities and processes thousands of orders every month. The main objective of this project is to analyze Urban Cart's sales data to help the business make more data-driven decisions. In this data analytics project, multiple database tables such as customers, orders, products, and payments are used to analyze customer behavior, sales trends, and product performance.
